

# Modular Framework

The GSatMicro Series framework is designed to support a full suite of modular components that enable different communication methods for both incoming and outgoing data. The core design of a smart, satellite-enabled terminal is enhanced by the following optional modules: Wireless, WiFi, GPS, & GSM. Each module serves as a supplemental communication method for custom integrations of the GSatMicro terminal. Modules are capable of being enabled, disabled and configured from within the core firmware without the addition of custom coding.

These customizable modules allow for a wide variety of applications across all verticals and industries. Input modules open up options for custom sensors or wireless applications, while the GSM module can be enabled to create a redundant hybrid solution.
